

## Project Description

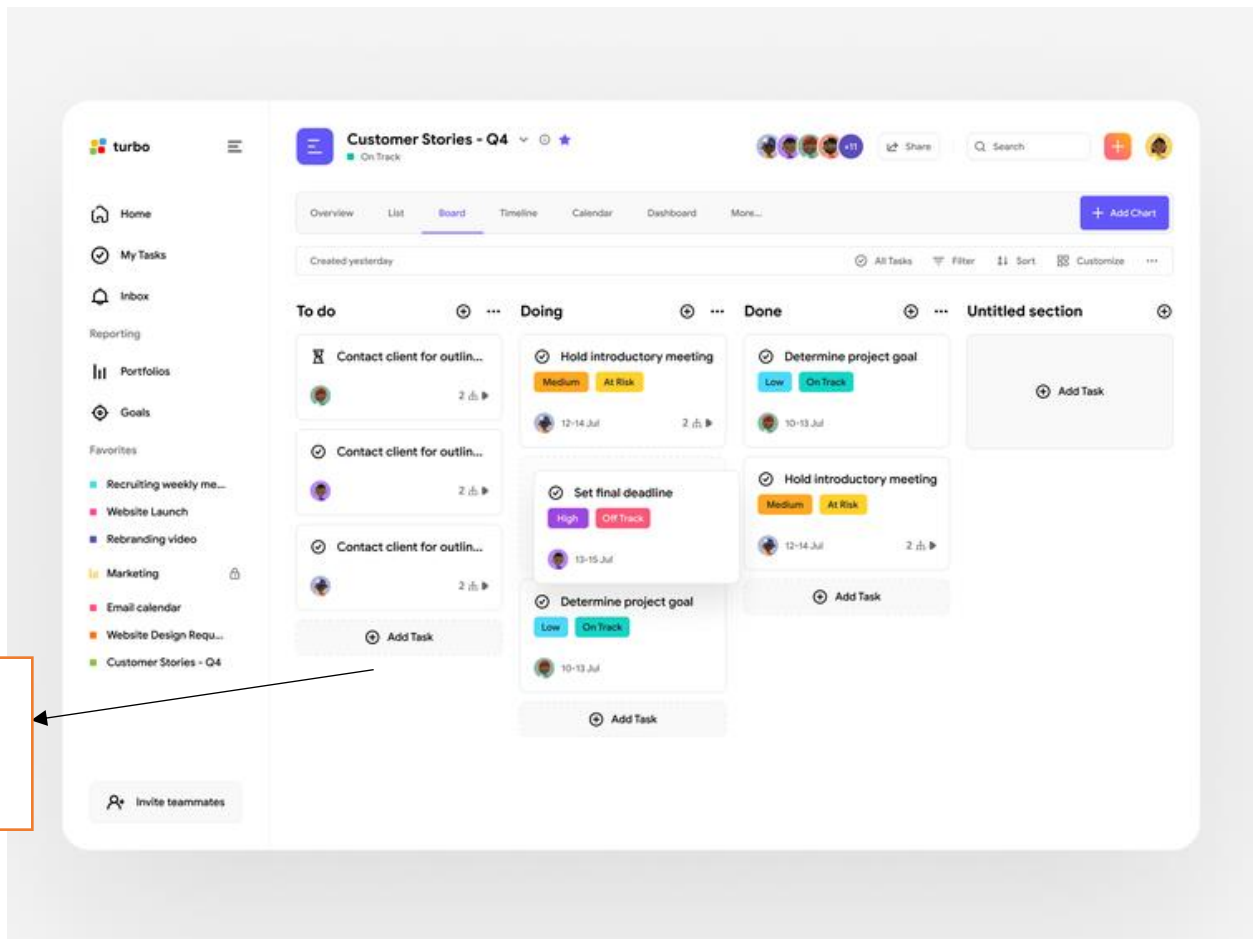

### Theme: Kanban Board Implementation

**Aim:** The aim of this project is to design a complete kanban board as per the UI below it should be very identical to the original image found below.

Functionalities to be implemented.

- As a user I should be able to add new task to my board
- As a user I should be able to move my task from marker to the other (e.g.: from Todo-Doing, Doing-Done etc... and vice versa).
- The displacement of a Todo should be done with the help of drag and drop.

For the moment these are the basic functionalities that has to be implemented so as to consider the job done (**Functionality 3 is very crucial if not implemented consider work as not done**)

This functionality should work properly.

**Note:**

- No need for database to store cards information for the moment you can use an array for the moment. (Expecting first prototype by Sunday (04-30-2022) hopefully you make It through). Good Luck

\*\*\*\*\*

\* Remember Carefully that an uncompleted work or lately submitted work is no work done. \*
